PROFILE

Backend engineer with eight years in production, mostly on consumer platforms with millions of users. I build Go services for video, live sports and real-time messaging: a short-video backend taking 100k+ uploads a day, a gamification platform for 3M+ users, and chat infrastructure holding 800k+ concurrent connections. Before that, national-scale systems for Iran's Ministry of Education. I care about domain boundaries that survive a rewrite, event-driven flows that degrade instead of collapsing, and code the next engineer can follow.

EXPERIENCE

Senior Backend Engineer · Saba Idea

Jan 2023 – Present · Remote

Backend services for Aparat, Saba Idea's video platform, and the products built around it.

Aparat Shorts 100k+ uploads / day

- Designed and built the backend for a Reels-style short-video feed: upload, processing and delivery.
- Kept it predictable under that load while the product shipped weekly, working with frontend and product teams on the hot paths.

Game Club · Aparat Sport 3M+ users

- Led backend development of a gamification platform on live sports: scoring, predictions, quizzes, missions, leagues and rankings.
- Built the processing on Kafka event flows and asynchronous workflows.
- Designed capacity for the traffic spike that lands the moment a match kicks off.

Apollo Cast real-time

- Built a real-time service that turns a phone into a remote control and a TV into the screen.
- WebSocket transport with device pairing and state sync, where anything past a few hundred milliseconds is felt.

Chat Service · Hamoon gateway 800k+ concurrent connections

- Built chat APIs and messaging workflows for text across Aparat channels.
- Built Hamoon, the WebSocket gateway underneath: it holds client connections, produces events into Kafka for other services and delivers their replies back to clients.
- Scales horizontally across pods on Kafka consumer groups, with graceful shutdown; stable at 800k+ concurrent connections without tail latency creeping up.

Backend Developer · Raya Dars

Dec 2021 – Jan 2023 · On-site

Contractor to Iran's Ministry of Education, the country's largest government organisation.

- Built national-scale services for financial aid, loans, registration and core administration.
- Built for systems that could not go down: stability and data integrity came first.

Full-Stack Developer · Zenouzi

Aug 2018 – Nov 2021 · On-site

- Built a product showcase and sales application for medical equipment in JavaScript, front end to back end, with reliability and maintainability as the standing priorities.

SKILLS

Languages

Go TypeScript JavaScript SQL

Architecture

Domain-Driven Design
Clean / Hexagonal Microservices
Event-driven REST gRPC
WebSocket High-traffic & spikes

Data

PostgreSQL Redis ScyllaDB
Cassandra MongoDB MySQL

Messaging & platform

Kafka NATS JetStream Docker
Kubernetes Linux GitLab CI
GitHub Actions

Observability & testing

OpenTelemetry Jaeger Grafana
pprof Benchmarks testify
Integration tests

Blockchain · personal projects

Solidity go-ethereum EVM
Event indexers Node operations
Wallet & key management TON
Solana Cosmos

Leadership

Technical leadership Mentoring
Code review

EDUCATION

B.Sc. Industrial Engineering

Islamic Azad University, South Tehran Branch

LANGUAGES

Persian

Native

English

Upper intermediate (B2)

SELECTED PROJECTS

Wishly · my own product

wishly.info

Wishlists and birthday reminders. Friends see what someone wants without spoilers or duplicates, and get a nudge by email or SMS a few days ahead. Available in three languages, Persian included.

Go · TypeScript

Homa · peer-to-peer terminal chat

github.com/Serajian/homa

Two people exchange one address and talk directly over WireGuard through NAT, on Tailscale's data plane with the control plane removed; a relay only helps when no direct path exists. No accounts and no server keeping messages. Peers are identified by key rather than by the name they announce, and file transfers are checked against a digest. Released as v0.1.0 through Homebrew and a signed apt repository.

Go · WireGuard · tailcat · GoReleaser · GitHub Actions

Srosha · asynchronous notification service

github.com/Serajian/srosha

A client submits once over gRPC and is acknowledged immediately; a separate dispatcher delivers across eight channels (Email, Telegram, Bale, WhatsApp, Matrix, Gotify, FCM, APNs) at least once, with per-channel retry and HMAC-signed status webhooks. Intake and delivery are separate binaries, so a broken provider never stops a request being accepted. Hexagonal core with the dependency rule checked on every commit, and a Go SDK that stays one toolchain version behind the service.

Go · gRPC · PostgreSQL · NATS JetStream · Docker
